Hi Helen,

Please find below a follow-up issue from our meeting on 9/14/15.

Proposed Outside Perimeter Wall Construction Alternative - Mitigation

The Tribe prefers the Pritchard Park West project over the pulling of the West Dock creosote piles as compensatory mitigation for the proposed outside perimeter wall construction alternative. The Pritchard Park West project would remove approximately 13,000 square feet of fill and 415 feet of shoreline armoring, and restore intertidal and riparian habitat. Additional discussions will be needed to evaluate all the potential impacts of the proposed perimeter wall construction alternative (e.g., loss of aquatic habitat, modifications to shoreline processes, impact to intertidal eelgrass beds) and the scale of compensatory mitigation needed.

A 30% design for the Pritchard Park West project was developed in May 2009 (attached). The west side of this project design may need to be modified due to the presence of archaeological deposits.

Please let me know if you have any questions.

Thank you,  
Rich
